ASET release notes

Version 2003r951

Lo Farnan

2nd December 2022

Release notes

Changes and bug fixes

1. An entry filter has been added to the name field in the test and profile entry screens. This filter prevents the user entering ',' (a comma character) which is a prohibited character in these fields.

2. The Vidas 5600 communication method has been modified to accept packets longer than 248 characters.

3. Changes have been made to the file naming method used by the EMIS interface to ensure the file names are always unique.

4. The HL7 request import interface could, under certain circumstances, import a request without assigning a sample type. The input HL7 does not contain the sample type and this is now inferred and entered as the test expected sample type.

5. In the HL7 request import interface the acceptable client reference field length has been increased to 20 characters.

6. In the HL7 request import interface the acceptable location code field length has been increased to 40 characters. This has been done to meet a specific requirement and the location code should be short if possible. This must be unique.

7. Two new buttons have been added to the validate by number screen to add new functionality.

The 'Add test' button will bring up a selection dialog listing all the available tests on the system. Selecting a test will create a new test for this request and schedule it for an analyser if this test is done on an analyser.

The 'Add to urgent list' button simply flags this request as containing a result that needs to be telephoned. The phone list is prompted when this function is enabled in the system preferences and following validation.

Additionally, the customer associated with this request is now displayed on this screen.

Customer specific changes

1. The large test request entry screen (being tested) has been removed and the original request entry screen is now the default. (I)
