ASET release notes

Version 2003r926

Lo Farnan

5th December 2021

Release notes

Changes and bug fixes

1. The test selection dialog has been modified to remove interface buttons for interfaces that do not need them.
2. The file saving mechanism for the ad-hoc PDF generation has been modified to fix a bug that prevented the saving of PDFs for customer who do not routinely receive PDF reports.
3. Fixed a bug in the PAS request entry from the main button screen. Under some circumstances when there are no pending PAS requests a 'loading test/sender data' progress message was displayed that could not be cleared.

Customer specific changes

1. Enabled the PAS request entry button on the customer specific request entry screen. (P)
2. Fixed an HL7 receipt writing failure when a pathname contained a missing field. This led to a filename with a '..' which Windows objects to. A non-entered client reference number is now rendered as '00000' in the file name. (P)
3. The sample ID field on the customer specific entry screen is now mandatory and will generate an error if left blank. (C)
