ASET release notes

Version 2003r953

Lo Farnan

8th February 2023

Release notes

Changes and bug fixes

1. An issue with the billing of tests requested by the reflex mechanism was identified that meant some of these were not generating the required invoice item. This was related to the rate card mechanism and has now been resolved.

2. A new EMIS result delivery interface has been developed that replaces the existing mechanism. This now uses the main ASET interface engine rather than the specific code of the older version.

3. The standard test comment and test result functions were not working as designed:

These values if entered are now being assigned when a request is booked in. A standard result will complete the test result and place that record in the validation queue.

4. If a result was entered using the stamp function any comment attached to the stamp would overwrite any existing test comment. This functionality has been changed and any stamp comment is appended to any existing comment.

5.

Customer specific changes

1. The HL7 requesting interface has been modified to reject requests where a matching existing patient already exists in ASET. The matching is done using the supplied patient ID (PID-2) which ASET uses as a unique internal patient identifier. Any request that matches an existing patient is now rejected and the input HL7 file is moved into the 'failed' folder. Any rejected input generates an on-screen message detailing the rejection reason and the input file name. (I)
